                                  Humanised CDR-grafted 5G1.1 scFv CB (AAR77607) is the product of a DNA construct (AAT08479) derived from DNA of hybridoma ATCC HB 11625, the producer of anti-C5 monoclonal antibody (MAD) 5G1.1. Recombinant scFv CB is obtd. by expression of this DNA in Escherichia coli using vector pET Trc SO5/NI. The light and/or heavy chain CDRs of scFv CB can be combined with CDRs from other 5G1.1-derived antibodies, Fds and light chains (AAR77606-16) in the prodn. of recombinant, including humanised, antibodies that retain the ability of MAD 5G1.1 to block human complement C5a generation and thus to reduce glomerular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Key

                      A humanised CDR-grafted scFv, designated 5G1.1 scFv DO12 (AAR77616), includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. The scFv can be expressed in Escherichia coli MEI cells by subcloning of encoding DNA (AAR708488) into vector pET Trc SO5/N1. This humanised, recombinant antibody retained the ability of MAb 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis.

                                                                                                                                                                                                                                                Murine scFv 5G1.IM1 (AAR77606) is the product of a DNA construct (AAT08479) obtd. from DNA of hybridoma ATCC HB 11625, which produces anti-C5 monoclonal antibody (MAD) 5G1.1. Recombinant scFv 5G1.IM1 is obtd. by expression of this DNA in Escherichia coli using vector pET Trc SO5/NI. The light and/or heavy chain CDRs of scFv 5G1.IM1 can be combined with CDRs from other 5G1.1-derived antibodies, Fds and light chains (AAR77607-16) in the prodn. of recombinant, including humanised, antibodies that retain the ability of MAD 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with

                                                                                                                                                                             Align seg 1/1 to:
                                                                                                                                                                                                                                                                                                                                                                                                                           cytoplasmic signalling components. Also claimed is use of DNA cencoding a recombinant chimeric receptor in a DNA delivery system. The DNA delivery system can be used for the activation of cells to provide e.g. an increase in cell proliferation, expression of cytokines with e.g. pro- or anti-inflammatory responses, stimulation of cytolytic activity, differentiation or other effector functions, antibody secretion, phagocytosis, tumour infiltration and/or infectious disease, inflammatory disease, cancer, allergic/atopic disease, congenital disease, dermatologic disease, transplants and metabolic/idiopathic disease (claimed). In particular, they can be used in the treatment of e.g. cisease, transplants and metabolic/idiopathic disease (claimed). In particular, they can be used in the treatment of rheumatoid arthritis, osteoarthritis, sickle cell anaemia, psoriasis, multiple sclerosis, organ or tissue transplant rejection, graft-versus-host
                                                                                                                                                                                                                                                                      Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This protein comprises a chimeric receptor consisting of an scFv engineered from anti-CD3 human antibody CTMO1 linked to an extracellular spacer comprising the human IgG1 hinge, part of the extracellular region of human CD28 and 4 amino acid residues, linked to the transmembrane and intracellular regions of the human T cell receptor zeta chain. It can be expressed in host (e.g. Jurkat) cells using a chimeric receptor gene (see AAT90514) constructed from DNA cassettes encoding each component of the receptor. In a claimed cell activation process an effector cell is transformed with DNA encoding a chimeric receptor containing 2 or more different cytolasmic signalling components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric - Homo
                                                                                                                                                                                                                                                                                                                                                                               Sequence

In a CC claimed cell activation process an effector cell is transformed with CC DNA encoding a chimeric receptor containing 2 or more different CC cytoplasmic signalling components. Also claimed is use of DNA CC encoding a recombinant chimeric receptor in a DNA delivery system. CC The DNA delivery systems can be used for the activation of cells to provide e.g. an increase in cell proliferation, expression of cytokines with e.g. pro- or anti-inflammatory responses, stimulation of cytolytic activity, differentiation or other effector functions, antibody secretion, phagocytosis, tumour infiltration and/or increased adhesion. They can be used in the treatment of e.g. C disease, congenital disease, dermatologic disease, congenital disease, dermatologic disease, ransplants and metabolic/diopathic disease, asthma. C eczema, cystic fibrosis, sickle cell anaemia, psoriasis, multiple c sclerosis, organ or tissue transplant rejection.

Also claimed is use of DNA encoding a recombinant chimeric receptor in a DNA delivery system. The DNA delivery systems can be used for the activation of cells to provide e.g. an increase in cell proliferation, expression of cytokines with e.g. pro- or anti-inflammatory responses, stimulation of cytolytic activity, differentiation or other effector functions, antibody secretion, phagocytosis, tumour infiltration and/or increased adhesion. They can be used in the treatment of e.g. infectious disease, inflammatory disease, cancer, allergic/atopic disease, transplants and metabolic/idiopathic disease (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This protein comprises a chimeric receptor consisting of an scFv engineered from anti-CD3 human antibody CTMO1 linked to an extracellular spacer in the form of part of human CD8 hinge, linked to the extracellular, transmembrane and intracellular components of the human T cell receptor zeta chain. It can be expressed in host cells (e.g. Jurkat) using a chimeric receptor gene (see AAT90509) constructed from DNA cassettes of each component. In a claimed

cell encoding a chimeric receptor containing 2 or more different
cytoplasmic signalling components. Also claimed is use of DNA
ce encoding a recombinant chimeric receptor in a DNA delivery system.
ce needing a recombinant chimeric receptor in a DNA delivery system.
ce provide e.g. an increase in cell proliferation, expression of
cytokines with e.g. pro- or anti-inflammatory responses, stimulation
ce of cytolytic activity, differentiation or other effector functions,
ce antibody secretion, phagocytosis, tumour infiltration and/or
increased adhesion. They can be used in the treatment of e.g.
ce increased adhesion. They can be used in the treatment of e.g.
ce disease, congenital disease, dermatologic disease, neurologic
disease, transplants and metabolic/idiopathic disease (claimed).
ce arthritis, osteoarthritis, inflammatory bowel disease, asthma,
ce czema, cystic fibrosis, sickle cell anaemia, psoriasis, multiple.
ce sclerosis, organ or tissue transplant rejection, graft-versus-host

```
CC cell receptor zeta chain. It can be expressed in host cells (e.g. Jurkat) using a chimeric receptor gene (see AAT90512) constructed CC from DNA cassettes encoding each receptor component. In a claimed CC cell activation process an effector cell is transformed with DNA CC encoding a chimeric receptor containing 2 or more different CC cytoplasmic signalling components. Also claimed is use of DNA CC encoding a recombinant chimeric receptor in a DNA delivery system. CC The DNA delivery systems can be used for the activation of cells to CC provide e.g. an increase in cell proliferation, expression of CC cytokines with e.g. pro- or anti-inflammatory responses, stimulation CC of cytolytic activity, differentiation or other effector functions, CC antibody secretion, phagocytosis, tumour infiltration and/or CC infectious disease, inflammatory disease, cancer, allergic/atopic CC disease, congenital disease, dermatologic disease, neurologic CC disease, transplants and metabolic/idiopathic disease (claimed). CC In particular, they can be used in the treatment of rheumatoid CC arthritis, osteoarthritis, inflammatory bowel disease, asthma, cezema, cystic fibrosis, sickle cell anaemia, psoriasis, multiple CC disease or disheres (claimed). Claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                          This protein comprises a chimeric receptor consisting of an scientification anti-CD3 human antibody CTMOI linked to an extracellular spacer comprising the human IgG1 hinge, CH2 and cextracellular spacer comprising the human intracellular regions of the human linked to transmembrane and intracellular regions of the human

cassettes encoding each component of the receptor. In a claimed cell activation process an effector cell is transformed with DNA encoding a chimeric receptor containing 2 or more different cytoplasmic signalling components. Also claimed is use of DNA encoding a recombinant chimeric receptor in a DNA delivery system. The DNA delivery systems can be used for the activation of cells to provide e.g. an increase in cell proliferation, expression of cytokines with e.g. pro- or anti-inflammatory responses, stimulation of cytolytic activity, differentiation or other effector functions, antibody secretion, phagocytosis, tumour infiltration and/or infectious disease, inflammatory disease, cancer, allergic/atopic disease, congenital disease, dermatologic disease, neurologic disease, transplants and metabolic/idiopathic disease (claimed). In particular, they can be used in the treatment of rheumatoid artherity forces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein comprises a chimeric receptor consisting of an scFv engineered from anti-CD3 human antibody CTMO1 linked to an extracellular spacer comprising the Human IgG1 hinge, CH2 and CH3, linked to the transmembrane and intracellular components of the human T cell receptor zeta chain, fused to the intracellular region of human CD28. It can be expressed in host cells (e.g. Jurkat) using a chimeric receptor gene (see AAT9033) constructed from DNA constructed from DN
                                                               sclerosis, organ or tissue transplant rejection, disease or diabetes (claimed).
                                                                                                                                  arthritis, osteoarthritis, inflammatory bowel disease, asthma, eczema, cystic fibrosis, sickle cell anaemia, psoriasis, multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New DNA systems for activating cells -

The present sequence encodes a fusion of the single chain antibody thunk-IJ-10 and streptavidin. The antibody binds the antigen EGP40 or EPCAM. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a first nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid, operatively linked to a promoter construct comprises a first nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of or treating. A target site within a mammalian

molety, the TYSE being capable of forming a stable complex with 2 other TYSEs, with the proviso that the heterologous molety is different from any of the fusion proteins CIIH6FXTN123, H6FXTN123, H6FXTN123 (AAW94261 to AAW94264). The TYSE can be used for the construction of conjugates with heterologous moleties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive molety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent entities for generating chimeric artificial antibodies having preselected pharmacokinetic and/or pharmadynamic properties. The constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous
                                  population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence represents a H6FXscFv(CEA6)tripBscFv(CEA6) fusion protein sequence encoded by the plasmid pH6FXscFv(CEA6)tripBscFV(CEA6).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (HOLT/)

They comprise a first FV fragment bound to at least one other FV fragment by a linker which keeps the FV fragment apart. The connecting structure of AAR20184 comprises a joining sequence derived from a human IgG1 domain linked to a complete human IgG4 hinge region. AAR20185 is the sequence of the shortened hinge version of the B72.3 single chain FV

The present invention describes a method for causing apoptosis in whi a fused gene consisting of a gene participating to apoptosis and a genecoding at least the variable region of anti-idiotype antibody is transfected to a cell to express the fused gene and then an idiotype antibody is reacted with the expressed cell. The method is useful in medical, pharmaceutical, pharmacological and biochemical fields. The

The present sequence represents a bscCD19xCD3 antibody. This antibody is a bispecific single-chain polypeptide comprising domains providing binding-site of immunoglobulin chains or antibodies specifically recognizing CD19 and CD3 antigen. The polypeptide destroys CD19-positive target cells without any need of T-cell pre and/or co-stimulation, by recruiting cytotoxic T-lymphocytes and so specific lysis by T-cells rather than a direct effect by an antibody is achieved. The bispecific single-chain polypeptides, or nucleotides encoding them, are used for the treatment of B-cell malignancies, B-cell mediated autoimmune diseases like myasthenia gravis, Morbus Basedow, Hashimoto thyroiditis or Goodpasture syndrome or for the depletion of B- cells and more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          bscCD19xCD3

The polynuclectide is used for gene therapy. The polypeptides are also used for identifying compounds modulating B-cell/T-cell mediated immune response with can turn be used for treating cancer, its related diseases and also for inhibiting viral diseases by preventing viral infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     645
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides an antibody having affinity to CD4 antigen. The invention of anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents the H chain sequence of the antibody 4H5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CD4 antigen; anti-human; antibody; 4H5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibody 4H5 H chain sequence.

"Isolation of the major outer-membrane protein of Actinobacillus pleuropneumoniae and Haemophilus parasuis.";

J. Vet. Med. B 42:59-63(1995).

-i- FUNCTION: STRUCTURAL RIGIDITY OF THE OUTER MEMBRANE OF ELEMENTARY BODIES AND PORIN FORMING, PERMITTING DIFFUSION OF SOLUTES THROUGH THE INTRACELLULAR RETICULATE BODY MEMBRANE.

-i- SUBUNIT: DISULFIDE BONDS INTERACTIONS WITHIN AND BETWEEN MOMP MOLECULES & OTHER COMPONENTS FORM HIGH MOLECULAR-WEIGHT OLIGOMERS

-i- SUBCELLULAR TICATION: INTEGRAL MEMBRANE PROTEIN. OUTER MEMBRANE.

OUTER COMPONENTS FORM HIGH MOLECULAR MEMBRANE.

OUTER COMPONENTS FORM HIGH MOLECULAR MEMBRANE.

OUTER MEMBRANE POTIN.

OUTER MEMBRANE POTIN.
